SQLiteSpy Full Product Key

SQLiteSpy is a small-sized and easy-to-use program that enables users to manage SQLite databases in a friendly working environment. It comes packed with limited features. As installation is not a prerequisite, you can just drop the executable file somewhere on the hard disk and run it directly. It is also possible to move SQLite to a USB flash disk or similar storage unit, in order to run it on any machine without prior installers. An important factor to take into account is that the Windows registry is not updated with new entries, and file traces do not remain on the system once the program is removed. The package also includes a DB3 database for testing purposes. Files can be loaded into the workspace using the file browser only, since the drag-and-drop support is not featured. The app supports SQLITE, SQLITE3, DB and DB3 formats. You can attach additional databases, build new SQL queries, view, copy and drop tables, edit cells, view “select” and “create” statements, as well as check out indexes, triggers and collations. It is possible to execute the entire SQL query or just a selection, analyze and vacuum the database, convert text to Unicode characters, enable read-only mode, set the decimal separator, as well as ignore regular expression matching cases. SQLiteSpy does not put a strain on system performance, as it runs on a very low amount of CPU and RAM. It has a good response time and works well, without causing the operating system to hang, crash or pop up error dialogs. All in all, SQLiteSpy offers a simple solution to viewing and executing SQL queries. Version: 1.1.1 Review: More... AppsDb is an easy to use and free database for Mac. It is simple and easy to use as it does not need installation. Its features include automatic backup, multiple data types, sorting and filtering and is also capable of saving. More... Przemek Pstryga added a comment on 1/29/09 9:57 PM - edited Aseprite is a wonderful example of what can be accomplished with a software and hardware package such as WINE. However, I still think that a proper OpenGL/GLUT3 package would be awesome! I was bored on Sat, so I wrote a quick prototype of a database viewer for the Mac. Windows I
